

Two of five signals clear chance

One of five differences is resolved

925 test steps, 4,000 percentile bootstrap replicates resampling SOLUTIONS, not steps: the design effect is 1.8-3.3, so a step-level bootstrap would have made every interval 1.3-1.8x too narrow. The right panel is paired on the same resamples, which is why its intervals are narrower than the left panel's would imply. Quoted text is the claim each comparison was written to support.
