

The threshold is made of false alarms

Equal AUROC, unequal value

Left: 64 seeds per point, band is a 95% CI on the mean; the shaded column is where the sweep cannot separate the gate from doing nothing. Right: the probe sits BELOW the curve for its own AUROC and the composite above it. The probe's score correlates +0.18 with step position and the composite's -0.28, while the projection only pays for the FIRST bad step. Calls/q differ across the three (1.18 synthetic, 1.09 token+sem, 0.96 probe); sweep D pins the rate and the ordering holds.
