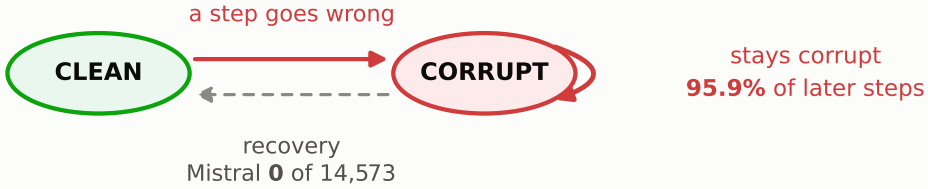
Corruption is close to absorbing



Llama 3.1 8B 81.6% (12 of 141 recover) | Qwen2.5-7B 66.4% (6 of 83)

Absorption decays *monotonically* as the generator improves.

Measured, not modelled (ch. 5). Entering corruption does not depend on the verifier; escaping it does -- which is why reach, not budget, is the controlling variable.
