
Left: every layer tried, not just the winner. Right: held-out AUROC over a SHUFFLED pooled training set, so size is the only thing changing. At fixed layer and C, doubling the data is worth +0.0105 (CI [-0.035, +0.057]). Two earlier versions of this panel were wrong: the first plotted the selection-split curve, the second an unshuffled pool whose composition drifted with its size.
